OFFICE AUTOMATION LAB · MINOR PROJECT

Health & Fitness Tracker

A Microsoft Excel-based system for recording, analyzing, and visualizing daily health and fitness activities.

Subject
Office Automation Lab

A structured record turns everyday activity into readable information.

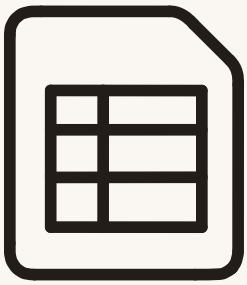

Project overview

This academic spreadsheet project turns daily activity records into summaries, comparisons, and a visual dashboard. The workbook is designed as a small information system: entries are captured once, calculations are automated, and the results are presented in forms that are easy to review.

30-day sample

Steps, workout type and duration, calories, water, sleep, meal pattern, weight, and a project-defined Wellness Score.

Seven sheets

Daily Tracker, Weekly Summary, Dashboard, Workout Analysis, Formula Guide, Instructions, and Data Dictionary.

Three chart types

Line, bar, and pie charts make trends, comparisons, and workout distribution easier to read.

02 · PURPOSE

Why the project matters

The tracker demonstrates practical Office Automation skills by connecting structured data entry with automated calculation, analysis, and communication.

- Record daily health and fitness information in an organized worksheet.
- Automate calculations using Excel formulas and functions.
- Create weekly summaries and compare workout patterns.
- Visualize progress through charts and a dashboard.
- Connect Excel implementation with Word documentation and PowerPoint presentation.

The dataset is fictional. The Wellness Score is a project-defined tracking indicator, not a medical or clinical measurement.

Inside the workbook

The workbook behaves like a small information system. Raw daily entries move through summaries and analysis before reaching the dashboard and its guidance sheets.

1. **Daily Tracker:** Records 30 daily entries and calculates the Wellness Score.
2. **Weekly Summary:** Converts daily values into weekly totals and averages.
3. **Dashboard:** Surfaces key performance indicators and visual trends.
4. **Workout Analysis:** Compares workout categories by days, minutes, and averages.
5. **Supporting sheets:** Document formulas, usage instructions, and field definitions.

From entry to interpretation: each sheet has a defined role.

How the calculations work

The workbook keeps its logic visible. Formula-driven fields turn individual records into comparable summaries while keeping the final values readable.

Wellness Score

Combines capped contributions from steps, workout duration, water, sleep, and meal pattern into a 0–100 project-defined indicator.

`MIN(100, total contribution)`

Readable output

Logic functions apply scoring conditions and keep the final result consistent for review.

`IF · MIN · ROUND`

FUNCTION	ROLE	WORKBOOK USE
SUM	Add values	Weekly totals
AVERAGE	Find a mean	Weekly averages
COUNTIF	Count by condition	Workout days
SUMIF	Sum by condition	Workout minutes

Representative Excel functions used in the project.

Features that make it usable

Small spreadsheet design choices make the tracker easier to complete, navigate, and interpret.

Controlled entry

Dropdown lists guide Workout Type and Meal Pattern entries.

Visible patterns

Conditional formatting makes selected values and patterns easier to notice.

Faster navigation

AutoFilter and Freeze Panes keep the Daily Tracker practical to scan.

Daily Steps Trend

A line chart shows movement across 30 days.

Workout comparison

A bar chart compares weekly workout minutes.

Workout distribution

A pie chart shows the distribution of workout types.

Development process

The build moved from planning and data preparation to formulas, analysis, usability checks, and final communication.

01

Plan

Define the Word, Excel, and PowerPoint deliverables.

02

Prepare

Build the 30-day fictional dataset.

03

Organize

Create the core and supporting sheets.

04

Calculate

Implement formulas and the project-defined Wellness Score.

05

Analyze

Build the Weekly Summary, Workout Analysis, Dashboard, and charts.

06

Format

Add validation, conditional formatting, AutoFilter, and Freeze Panes.

07

Test

Check formulas, summaries, and chart outputs.

08

Document

Explain the project in Word.

09

Present

Share the visual results in PowerPoint.

Workflow: Plan → Dataset → Formulas → Summary → Dashboard → Charts → Formatting → Testing → Report → Presentation

07 · OUTCOME

Conclusion and project outcome

The finished project shows how Excel can organize daily records, automate analysis, and communicate patterns through a compact dashboard.

- Daily health and fitness information can be recorded systematically.
- Calculations and summaries are automated through Excel formulas.
- Workout patterns and daily-step trends can be visualized.
- The project demonstrates practical skills in spreadsheet automation, data organization, formula-based analysis, data visualization, and professional documentation.

Tool roles: Excel serves as the implementation and analysis tool, Word as the documentation tool, and PowerPoint as the presentation tool.

A clear system makes progress easier to review.
